

SQL_LEVEL0

i build small program to simulate the sql injection in web browser .

▼ project idea

i select the country and salary will return according to country

▼ sql indicate

the first scenario \Rightarrow put whit parameter [`product_id=1'`] to indicate it injected or not

response will be internal server error

▼ use sample payload

`product_id=1+or+1=1`

response \Rightarrow

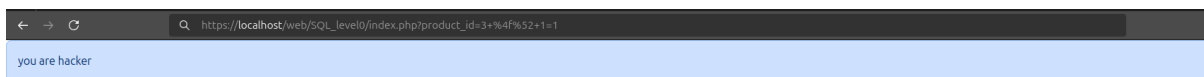

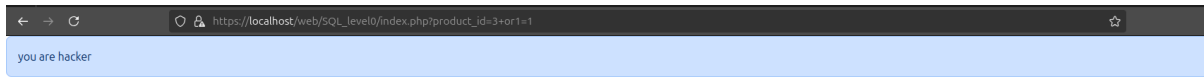

now you see all countries salary .

▼ stop payload by sample function

-lets create anther page code called test.php

and make loop to stop in each character to check if equal any payload characters

and if true return you are hacker like that =

this image i make the value of [or] to corresponding ascii-table

end : the program still have inject lets obtain that in SQL_LEVEL0.
